Article History: Received 14th September 2011, Revised 19th December 2011, Accepted 20th December 2011.

Abstract: The present study was conducted in Maruthamalai Hills (426.72 m MSL), which is located in the Coimbatore district, Southern Western Ghats of Tamil Nadu, India to explore the diversity of climbers and their curativeness. The study is primarily based on field surveys conducted throughout the hills, where dwellers provided information on plant species used as medicine, plant parts used to prepare the remedies and ailments to which the remedies were prescribed. A total of 55 plant species belonging to 45 genera comprises 20 families of medicinally important climbers were identified to be used by ethnic people to cure various ailments such as diabetes, dysentery, fever, headache, rheumatism, snakebite, cough, etc. It is evident from the study that, the ethnic people still values traditional medicines as a way of meeting their medical needs. This extensive knowledge among them can be tapped for bioprospecting, scientific scrutiny validation and utilization for posterity.

Keywords: Ailments; Curative climbers; Maruthamalai hills; Southern Western Ghats; Traditional Knowledge.

Introduction

Climbers are a typical constituent of rain forests. The distribution and abundance of climbing plants in forest varies greatly with the geographic locality of forests. Forest locality and type appears to influence the distribution of climbers (Grubb 1987). There is some evidence that vines are increasing in dominance in both tropical (Phillips et al. 2002; Wright et al. 2004; Swaine and Grace 2007) and temperate forests (Allen et al. 2007). Some authors consider that this pattern could be related to climate change (Malhi and Wright 2004).

Climbers not only form important structural components but also play important ecological role in forest dynamics, diversity and nutrient recycling (Gentry and Dodson 1984; Schnitzer and Bongers 2002). Liana species constitute a very important group of non-timber forest products, as it becoming clear over the last decade (Abbiw 1990; Malaise 1997; Van Andel 2000). In addition to being a conspicuous structural component of the rain forest, lianas play a important role as food plants for insects (Gentry 1985) and monkeys (Emmons and Gentry 1983) especially when other food sources are scarce (Sabatier 1985).

Lianas are also used by local people in many different ways. They may be especially important in remote areas where regular modern western medicines and various other products are not easily available and accessible (Arnold and Ruiz Perez 2001). Abbiw (1990) listed many uses for lianas and all kinds of other plants. Tra Bi (1997) and Tra Bi et al. (2002) studied the uses of lianas by the local population in Scio and Haut Sassandra forests of Cote’d Ivoire.

India is one of the 12 mega biodiversity centers with three hot spots of biodiversity viz., Western Ghats, Western Himalayas and eastern Himalayas. It is also endowed with a rich wealth of medicinal plants and is widely used by all sections of people either directly as folk medicines or indirectly in the pharmaceutical preparations. In the Western Ghats 80% of the medicinal plants in the world are available. Majority of the medicinal plants in India are higher plants with trees (33%), shrubs (20%), herbs (32%), climbers and others (3%). Nearly 60% of all dicotyledonous plant order has atleat one representative climber (Heywood 1993).
In recent years some workers (Palanisamy 1993; Balasubramanian et al. 1997; Hamasavalli 2001; Nikkitha 1999; Karthikeyan 2003; Senthilkumar 2004; Senthilkumar et al. 2005; 2006) have reported various medicinal plants used by Irular tribes in Coimbatore. However, no work has been attempted so far to ascertain the curative climbers from the study area. The present study attempts to document data on traditional knowledge of the primitive ethnic tribe Irulars of Maruthamalai hills related to medicinal uses.

Study area

The study area Maruthamalai Hills consists of an environment of moist dry deciduous type of forest at an altitude of 426.72 m MSL, 11.04' E of longitude and 76.93' N latitude. The area has a predominant red soil impregnated with organic matter, granite, bed rock is overlaid with shallow, sandy loam, and glacial soils are moderate to well drained. Temperature begins increasing after March and April is the hottest month with a near daily maximum temperature of 38.2º C. and minimum of 25 - 26 ºC.

The average rainfall received in the Coimbatore district is 670 – 699 mm for the past 20 years. After a warm, humid September, the regular monsoon starts from October lasting till early November. Out of the total rainfall 25% is received during south west monsoon 49% during October – November and remaining 21% during September. Although this rainfall is not enough to sustain the city for the entire year, small rivers like the Siruvani and Atthikadavu fulfil the city’s water needs.

Materials and Methods

The present study was carried out through intensive and extensive field visits during July 2010 – May 2011 to collect information on traditional uses of climbers used in the preparation of crude herbal drugs by the tribal people living in the Maruthamalai Hills of Coimbatore district. The data were documented through interviews, discussion and field observation with folk practitioners and knowledgeable people of the study area using standard methods adopted by Jain and Goel (1995).

During field survey, the plants have been collected in their flowering and fruiting stages as far as possible from the natural habitats. They were identified with the help of local floras (Gamble and Fischer 1915- 1936; Matthew 1983; Nair and Henry 1983; Henry et al. 1987; 1989; Chandrabose and Nair 1988). Further the identities were confirmed by referring authentic specimens in the Madras Herbarium (MH) of Botanical Survey of India, Southern Circle, Coimbatore and the voucher specimens deposited in the Herbarium of Department of Botany, Bharathiar University, Coimbatore, Tamil Nadu.

Results and Discussion

The present study resulted in the documentation of curative properties of 55 climbers belonging to 45 genera and distributed over 21 families. The plants are tabled with correct botanical names followed by family, local name, part(s) used and their medicinal uses (Table 1). Asclepiadaceae, Convolvulaceae and Fabaceae (8 species each) are most dominant families, followed by Cucurbitaceae (5 species), Menispermaceae and Aristolochiaceae (3 species each) and Apocynaceae, Capparidaceae, Sapindaceae and Liliaceae (2 species). Rest of the families are represented by single species (Figure 1).

Curative Climbers of Maruthamalai hills

5 Aristolochia bracteolata Lam. (Aristolochiaceae) Aduthinnapalai Whole parts Whole plant juice is applied through nose to cure headache, cold and fever.

6 Aristolochia indica L. (Aristolochiaceae) Isuramuli Leaves & roots Fresh roots and leaves are ground and mixed with water and given against snake bite.

7 Aristolochia tagala Cham (Aristolochiaceae) Roots Fresh root is grounded and applied externally against poison bites.

8 Asparagus asiaticus L. (Liliaceae) Leaves Paste of tender leaf is applied topically on swellings.

9 Bauhinia vahlii Wight & Arn. (Fabaceae) Kattu mantharai Leaves Leaf extract is taken orally to cure dysentery.

10 Capparis sepiaria L. (Capparidaceae) Karunjurai Leaves and Roots Leaf and root extract is used to cure skin diseases.

11 Capparis zeylanica L. (Capparidaceae) Adonodai Roots Root paste is applied to snakebite, boils and swellings.

12 Cardiospermum canescens Wall. (Sapindaceae) Periya mutakkathan Leaves Fresh leaf juice is taken internally to relieve joint pain.

13 Cardiospermum halicacabum L. (Sapindaceae) Mutakkathan Roots Crushed roots are applied on legs to cure swellings.

14 Ceripegia juncea Roxb. (Asclepiadaceae) Pulicham Stem Stem is crushed and the extract is taken along with milk to cure stomach ulcer.

15 Cissampelos pareira L. (Menispermaceae) Appata Leaves Leaf decoction is given orally to cure fever.

16 Cissus quadrangularis L. (Vitaceae) Pirandai Stem Tender stem extract is taken orally for stomach pain.

17 Citrullus lanatus (Thunb.) Mat. (Cucurbitaceae) Thannirpalam Fruits Fruits are consumed and act as cooling agent.

18 Clitoria ternatea L. (Fabaceae) Sanguppu Roots Root paste is taken orally to cure snake bite.

19 Coccinia grandis (L.) Voight, (Cucurbitaceae) Kovai Fruits Fruits consumed orally to control diabetes.

20 Cuculus hirsutus (L.) Diels. (Menispermaceae) Kottukkodi Roots Roots direction is given to cure stomach problems.

21 Corallocarpus epigaeus Clarke. (Cucurbitaceae) Akasha garudan Roots Dried root paste is applied externally for joint pains.

22 Cucumis trigonus Roxb. (Cucurbitaceae) Kattumatti Leaves Powdered leaves mixed with honey is taken daily for stomachache.

23 Cyclea peltata (Lam.) Hook. f. (Menispermaceae) Para Roots Root extract is given against snake bite.

24 Dioscorea oppositifolia L. (Dioscoreaceae) Kavala - kodi Tuber The cooked tuber is taken internally for increasing body vigour.

25 Diplocyclos palmaus (L.) C. Jeffrey. (Cucurbitaceae) Sivalingakkai Whole plant Whole plant juice is given orally for cough.

26 Gloriosa superba L. (Liliaceae) Akkini-chilam Roots Fresh root extract is given to cure leprosy and piles.

27 Grewia heterotricha Mast. (Tiliaceae) Periyaachu Stem bark Stem bark extract is given orally to cure cough.

28 Gymnema sylvestre (Retz.) R.Br. ex Sch. (Asclepiadaceae) Sakkaraikodi Leaves Leaf decoction mixed with milk is taken internally to cure diabetes.

29 Hemidesmus indicus R. Br. (Asclepiadaceae) Nannari Roots Decoction of roots is taken against snake bite.

30 Ichnocrurus frutescens (L.) R. Br. (Apocynaceae) Uddarkodi Roots Root decoction is taken orally to treat diabetes.

31 Ipomoea eriocarpa R.Br. (Convolvulaceae) Pulichavidi Roots Dried and powdered leaves are given orally with milk to treat rheumatism.

32 Ipomoea mauritiana Jacq. (Convolvulaceae) Palmudangi Roots Root powder is taken orally to control diabetes.

33 Ipomoea obscura (L.) K. Gawl. (Convolvulaceae) Siruttalai Leaves Fresh leaf juice is given to treat stomach ulcer.

34 Ipomoea pes-tigridis. L. (Convolvulaceae) Pulichakirai Leaves Powdered leaves are taken orally as an antidote to dog bites and boils.

35 Ipomoea pes-caprae (L.) R. Br. (Convolvulaceae) Adambu, attukkal Leaves Leaf juice is taken orally and to treat rheumatism.
The most commonly used medicinal climbers viz., *Abrus precatorius* L., *Aristolochia indica* L., *Cissus quadangularis* L., *Coccinia indica* (L.) Voight, Hort., *Gloriosa superba* L., *Gymnema sylvestre* (Retz.) R.Br. ex Sch., *Hemidesmus indicus* R.Br., *Tinospora cordifolia* (Thumb.) Miers and *Tylophora indica* (Burm. f.), which play an important role in the primary healthcare system of tribal community Irulars who residing in the study area. They are using these plants to cure diseases related to skin diseases, cough, fever, headache, diabetes, rheumatism, asthma, dysentery and poison bites (Figure 2).

It is evident from the study that, different plant parts of climbers were used as medicines, in which the leaves are most frequently used for the treatment of ailments followed by roots, whole plant, stem, rhizome and bark (Figure 3). The present study perceived that, mono-herbal therapy is used for more than one disease. For example, *Acacia torta* (cough and dysentery), *Aristolochia bracteolata* (headache and fever), *Capparis zeylanica* (snake bite and sweeteings), *Pergularia daemia* (asthma and insect bites), *Pseudarthria viscida* (fever, asthma and diabetes), *Rivea hypocarteriformis* (cough and headache) and *Tinospora cordifolia* (rheumatism and urinary diseases). These remedies are taken internally or applied externally in the form of paste, decoction, powder and extract. Most of

the plants are used either mixed with other ingredients or used singly.

The study reveals that most of the people in the study area cultivate some of the common medicinal plants in their home gardens either for medicinal use or for used as vegetables. In the view of greater importance of medicinal herbal plants, many of the progressive farmers are focused over to cultivate of these plants as they found it to be more profitable than traditional crops. It is essential to impart necessary training in mass to enhance the economic condition of tribal poor and progressive farmers.

**Conclusion**

Medical plants play a major role in the medical and healthcare needs of tribal people. This preliminary study focused on documenting most of the curative climbers used by the Irular community in Maruthamalai hills, the Southern Western Ghats of Tamil Nadu to facilitate conservation efforts. However, destruction of habitat through deforestation and over exploitation for commercial purposes and changes in cultural altitude threatens to constrain many of these species in to extinction.

**Acknowledgements:** Authors wish to express their gratitude to the tribal peoples of the area for their active interaction during the field studies. Authors are also thankful to Dr. S. Manian, Professor and Head, Department of Botany, Bharathiar University, Coimbatore for providing necessary facilities to carry out the study.
